Jewelry production

A jewelry store makes necklaces and bracelets using 18 ounces of gold and 20 ounces of platinum. Each necklace needs 3 ounces of gold and 2 ounces of platinum; each bracelet needs 2 ounces of gold and 4 ounces of platinum. Bracelet demand is at most 4. Profit is $300 per necklace and $400 per bracelet.

a. Formulate the linear programing model
b. Solve this model using graphical analysis
